## SUMMARY

Product-minded engineer with 3+ years of experience taking software from user discovery through production support across government-scale workflows and B2B SaaS. Co-founded SpotBook and built its first production deployment for live apparel expos; interviewed operating teams, translated their workflow needs into mobile-first experiences, and paired simple interfaces with reliable Spring Boot and PostgreSQL systems. Strengths include Java, React, product discovery, transactional workflow design, REST APIs, and end-to-end delivery.

## TECHNICAL SKILLS

- Backend:** Java 17, Spring Boot 3, Spring Security, Hibernate/JPA, REST API Design, JWT, RBAC
- Frontend & Product:** React, TypeScript, Redux Toolkit, RTK Query, Tailwind CSS, mobile-first interaction design, product discovery
- Data & Architecture:** PostgreSQL, Oracle SQL, MySQL, SQL optimization, schema design, Flyway, multi-tenant architecture, modular monoliths, concurrency control
- Quality & Delivery:** JUnit 5, Mockito, integration testing, regression testing, TDD, Docker, Maven, Jenkins-based CI/CD, Git
- AI-Assisted Engineering:** Codex, Cursor, Antigravity; code review and test-driven validation of AI-assisted output

## EXPERIENCE

**Co-Founder & Full-Stack Developer**  
*SpotBook — B2B SaaS for apparel manufacturers*

Aug 2025 – Jun 2026  
*Pune / Surat*

- Interviewed five apparel manufacturers and their teams, then translated expo-floor workflows into a mobile-first order product built around the daily users as well as business owners.
- Built and deployed SpotBook's first production order-management application in 15 days for an apparel manufacturer; it processed approximately Rs. 9 Cr in goods bookings across two expo seasons.
- Designed a POS-style React and TypeScript ordering flow with a focused QR-to-cart modal, large button-driven quantity controls, visual stock states, optimistic updates, and persistent cart state for noisy expo-floor use.
- Designed delta-based stock validation for in-place order editing, combining identity-based frontend diffs with transactional inventory controls to preserve order history and prevent overselling.
- Architected the multi-tenant Spring Boot modular monolith with Hibernate tenant isolation and domain boundaries, enabling separate manufacturer accounts on a shared database without cross-tenant data leakage.
- Built idempotent order creation and pessimistic inventory locking for live expo conditions, eliminating concurrency failures across 50+ peak concurrent sessions while maintaining sub-200 ms order synchronization.

**Project Engineer**  
*C-DAC (Centre for Development of Advanced Computing) — Client: EPFO, Govt. of India*

Apr 2023 – Aug 2025  
*Pune, Maharashtra*

- Developed Spring Boot modules for Form 19 and Form 31 claim workflows on EPFO's UAN Portal, contributing to automation of 2.34 crore auto-settled claims in FY 2024–25.
- Integrated Aadhaar-based Protean eSign into the claim pipeline, enabling legally valid digital signing and automating 70% of advance claims within three days of filing.
- Built REST APIs and React claim-filing components for high-volume self-service workflows, working with backend and QA teams to improve the digital experience for citizens.
- Optimized schemas, indexes, and audit-history queries for claims workflows, improving query performance by 35% while maintaining compliance-grade audit trails.
- Implemented Spring Security, JWT authentication, and role-based access control across API endpoints; wrote JUnit and integration tests for critical workflow paths and used Maven and Jenkins-based CI/CD in release delivery.

## EDUCATION

**PG Diploma in Advanced Computing**  
*C-DAC — Web Application Development*

Sep 2022 – Mar 2023  
*Top 10% of cohort*

**B.E., Computer Science & Engineering**  
*Prof. Ram Meghe Institute of Technology & Research*

Jul 2017 – Mar 2022  
*Amravati, Maharashtra*
