SUMMARY

Full-Stack Software Engineer with 3+ years building production systems — from government-scale platforms processing 3M+ claims/month to delivering a B2B SaaS as a freelance developer that handled ~Rs. 9 Cr (\$1.1M) in wholesale bookings. Strong in Spring Boot, React, PostgreSQL, and system design. Effective in both collaborative team environments (C-DAC/EPFO) and high-autonomy delivery — bringing full-lifecycle product engineering to every role.

TECHNICAL SKILLS

- **Backend:** Java 17, Spring Boot 3, Spring Security, Hibernate/JPA, REST APIs, JWT/RBAC, Spring Cache, Multithreading
- **Frontend:** React 18/19, TypeScript, Redux Toolkit, RTK Query, TailwindCSS, Vite
- **Database:** PostgreSQL, Oracle SQL, MySQL, SQL Optimization, Schema Design, Flyway Migrations
- **Testing:** JUnit 5, Mockito, TDD, Integration Testing, Regression Testing
- **DevOps & Cloud:** Docker, Nginx, AWS (EC2, S3), Railway PaaS, CI/CD, Git
- **Architecture:** Multi-Tenant, Modular Monolith (Spring Modulith), Microservices (patterns), Event-Driven, System Design

EXPERIENCE

Freelance Full Stack Developer

SpotBook & ExpoApp — B2B Software for Apparel Manufacturers (2-person team)

Aug 2025 – Jun 2026

Pune / Surat

ExpoApp — 15-Day Client Delivery for P10 Denim (www.p10denim.co)

- Eliminated paper-based expo ordering and prevented ~Rs. 40L in potential booking errors by collaboratively building a full-stack order management system in 15 days — processed Rs. 9 Cr (\$1.1M) across 2 live apparel expos with 99% uptime and zero overbooking disputes
- Reduced order entry time 3x over paper by building a POS-style mobile-first UI (React + Redux Toolkit + RTK Query) with optimistic updates, cart persistence, and concurrent multi-user session handling — designed for 5-inch phone screens in noisy expo halls
- Achieved production-stable deployment with 30-second automated WhatsApp receipt delivery by containerising with multi-stage Docker builds, Nginx reverse proxy, and WhatsApp Business API (Meta Cloud API) integration

SpotBook SaaS — Multi-Tenant Architecture Evolution (www.spotbook.online)

- Enabled multi-manufacturer SaaS scaling with zero cross-tenant data leakage by architecting a Spring Boot 3 modular monolith with Hibernate `@Filter`-based tenant isolation and strict module boundaries (Zones 0–8) — preserving a clean microservices migration path
- Eliminated all concurrency failures across 50+ simultaneous expo sessions by implementing pessimistic locking (`SELECT ... FOR UPDATE`) and idempotent order creation with custom `@EntityGraph` annotations — order sync latency under 200ms
- Prevented overselling during in-place order edits by designing delta-based stock validation — frontend identity-based diffing + backend `EDITING_RESERVED` transitional status + pessimistic inventory locking, preserving order identity and audit trail
- Enabled efficient inventory aggregation and variant filtering by migrating catalog schema from JSONB templates to normalised relational model (products → variants → skus → sku_prices) with Flyway migrations
- Caught critical concurrency and stock validation edge cases before every live expo deployment by applying TDD with JUnit 5 and Mockito — covering pessimistic locking paths, delta validation, and multi-tenant isolation with integration and regression tests

Project Engineer

C-DAC (Centre for Development of Advanced Computing) — Client: EPFO, Govt. of India

Apr 2023 – Aug 2025

Pune, Maharashtra

- Contributed to automating 23.4M claims by developing Spring Boot workflow modules for Form 19 and Form 31 claim processing in a cross-functional team on EPFO's UAN Portal
- Maintained 99.9% uptime across 3M+ monthly transactions by collaboratively building and optimising RESTful APIs for EPFO's UAN Portal dashboards — one of India's largest government digital platforms
- Cut claim processing time from 7–10 days to under 3 by integrating Aadhaar eSign (Protean) into the claim pipeline, enabling legally valid digital signatures for 70% of advance claims within filing day

- Improved query performance by 35% by redesigning database schemas with optimised indexing for claims, audit logs, and transaction history — maintaining compliance-grade audit trails for government financial data
- Reduced unauthorised access attempts by 90% by implementing Spring Security with JWT-based authentication and role-based access control across EPFO’s API endpoints
- Drove 20% higher self-service adoption across millions of users by developing ReactJS claim filing UI components in close collaboration with the backend and QA teams

TECHNICAL PROJECTS

Findrr — B2B Recommendation Engine · Deployed Mini Project (Live)	Aug 2026
• Replaced 5-table relational JOIN chains with $O(k)$ graph traversals by designing a B2B property graph data model with materialised shortcut edges in CognoDB — enabling real-time manufacturer recommendations • Resolved Bolt v5 protocol incompatibility between Neo4j driver and CognoDB by implementing JVM classpath shadowing in Java and runtime monkey-patching in Python to bypass vendor handshake validation	

EDUCATION

PG Diploma in Advanced Computing	Sep 2022 – Mar 2023
<i>CDAC — Specialized in web application development</i>	<i>Ranked in top 10% of cohort</i>
B.E., Computer Science & Engineering	Jul 2017 – Mar 2022
<i>Prof. Ram Meghe Institute of Technology & Research, Amravati</i>
