SUMMARY

Java and Spring Boot engineer with 3+ years of enterprise and B2B SaaS experience, now focused on AI-agent applications in Spring AI. Built IECSA, a production-oriented customer-success agent prototype spanning tool calling, MCP integration, RAG, memory, multi-agent delegation, guardrails, and evaluation. Brings production experience with secure APIs, transactional data, concurrency, testing, and deployment from EPFO and SpotBook.

TECHNICAL SKILLS

- **AI Agent Engineering:** Spring AI, ChatClient, LLM tool calling, MCP, RAG, VectorStore, local ONNX embeddings, agent skills, multi-agent orchestration
- **AI Reliability:** session memory, long-term fact extraction, HITL approvals, prompt-injection filtering, Gemini safety settings, LLM-as-a-Judge evaluation
- **Backend:** Java 21/17, Spring Boot 3, Hibernate/JPA, Spring Security, REST APIs, JWT, RBAC, Spring Modulith
- **Data:** PostgreSQL, Oracle SQL, MySQL, H2, schema design, SQL optimization, indexing, Flyway
- **Testing & Delivery:** JUnit 5, Mockito, unit/integration/regression testing, TDD, Docker, Nginx, AWS EC2/S3, Railway, CI/CD practices
- **AI-Assisted Engineering:** Codex, ChatGPT, Cursor, Antigravity; reviewed and tested generated code before integration

SELECTED AI PROJECT

IECSA - Intelligent Enterprise Customer Success Agent

2026

Independent Project - Production-Oriented Spring AI Prototype

Pune

- Built a Java 21 and Spring AI customer-success agent prototype across seven stages: local tools, MCP, RAG, SOP skills, memory, supervisor-worker delegation, guardrails, and LLM evaluation.
- Implemented grounded policy workflows with Spring AI ChatClient, MCP CRM tools, local ONNX vector retrieval, and dynamic SOP runbooks; added batch retrieval to avoid agent-driven N+1 calls.
- Configured bounded, session-isolated short-term memory with MessageWindowChatMemory and a ten-message window to preserve active context while controlling prompt growth.
- Built asynchronous long-term fact extraction with Spring events and JPA/H2 storage, then injected retrieved customer context into subsequent agent conversations.
- Designed isolated supervisor-worker contexts with session memory, thread-local request propagation, asynchronous JPA-backed fact extraction, HITL approval/resume flows, and prompt-injection filtering.
- Diagnosed Gemini multi-turn tool-calling state requirements and moved from an OpenAI-compatible endpoint to Spring AI's native Google GenAI integration for thought-signature handling.

EXPERIENCE

Co-Founder & Full-Stack Developer

SpotBook - B2B SaaS for Apparel Manufacturers

Aug 2025 – Jun 2026

Pune / Surat

- Co-developed a full-stack order-management platform for P10 Denim in 15 days; it processed Rs.9 Cr in goods bookings across two live apparel expos.
- Architected a multi-tenant Spring Boot modular monolith with Hibernate `@Filter`-based tenant isolation across six domain modules for shared-database use.
- Enforced Spring Modulith boundaries through a shared kernel and inter-module API contracts, keeping cross-domain dependencies explicit as the codebase grew.
- Designed concurrent order workflows with pessimistic inventory locking, idempotent order creation, and delta-based stock validation; maintained order-sync latency below 200 ms across 50+ concurrent sessions.
- Migrated the catalog from JSONB templates to a normalized PostgreSQL schema with Flyway, supporting variant-level inventory aggregation, price lookups, and reliable filtering.
- Implemented Spring Security, JWT authentication, and role-based access control across five user roles, enforcing least-privilege access at the API layer.
- Applied JUnit 5, Mockito, integration tests, and regression testing to concurrency, inventory validation, and tenant-isolation paths before live expo deployments.
- Built an asynchronous WhatsApp notification pipeline with Apache PDFBox receipts, AWS S3 storage, and Meta Cloud API delivery that did not block booking confirmation.

Project Engineer

C-DAC (Centre for Development of Advanced Computing) - Client: EPFO, Govt. of India

Apr 2023 – Aug 2025

Pune, Maharashtra

- Developed Java Spring Boot modules for Form 19 and Form 31 provident-fund claim workflows on EPFO's UAN Portal, contributing to high-volume government workflow automation.
- Integrated Aadhaar-based Protean eSign into claim processing, adding legally valid digital signatures within a secure enterprise application workflow.
- Implemented Spring Security, JWT authentication, and role-based API controls for claim-processing workflows handling sensitive financial data.
- Built and maintained REST APIs for dashboard, claim-status, and transaction-history features in a high-volume government digital platform.
- Improved claim, audit-log, and transaction-history data models through schema design, indexing, and SQL optimization, improving query performance by 35% while retaining audit requirements.
- Wrote JUnit and integration tests for critical claim workflows, helping validate releases and reduce regression risk before deployment.

EDUCATION

PG Diploma in Advanced Computing

C-DAC - Web Application Development

Sep 2022 – Mar 2023

Top 10% of cohort

B.E., Computer Science & Engineering

Prof. Ram Meghe Institute of Technology & Research, Amravati

Jul 2017 – Mar 2022
